

1. Introduction

1.1 Background

In America, an average person moves about eleven times in their lifetime. This brings us to the question: Do people move until they find an area to calm down where they really feel happy, or do our wants and wishes change over time, prompting us to eventually leave a town we once called home for a replacement area which will bring us satisfaction? Or do we too often move to new area without knowing exactly what we are getting into, forcing us to turn tail and run at the first sign of discomfort? To minimize the chances of this happening, we should always do proper research when planning our next move in life. Consider the following factors when picking a new place to live so you do not end up wasting your valuable time and money making a move, you will end up regretting. Safety is a top concern when moving to a new area. If you do not feel safe in your own home, you are not going to be able to enjoy living there.

1.2 Problem

The crime dataset of London found on Kaggle has crimes in each Boroughs of London from 2008 to 2016. The year 2016 being the newest we'll be considering the info of that year which is old information as of now. The crime rates in each borough may have changed over time. This project aims to select the safest borough in London based on the total crimes, explore the neighbourhoods of that borough to find the 10 most common venues in each neighbourhood and eventually cluster the neighbourhoods using k-mean clustering.

1.3 Interest

Expats who are considering relocating to London will be interested to identify the safest borough in London and explore its neighbourhoods and common venues around each neighbourhood.
